

Managing Storage Task :

1. Add a Second Disk to your Machine and Create two Primary partitions on your server. Create both partitions with a size of 100 MiB. One of these partitions must be configured as swap space; the other partition must be formatted with an Ext4 file system.
2. Add a label to the second partition to be “FinanceData”.
3. Configure your server to mount these partitions. Mount the Ext4 partition on **/mounts/data** and mount the swap partition as **swap** space.
(make a mount using the name, Label and UUID)
4. Create a backup from the second disk .
5. Revert the second disk status as a raw disk space and create two Partitions using GPT partitioning scheme .Both partitions with a size 1 GiB . . One of these partitions must be configured as swap space; the other partition must be formatted with an Ext4 file system.
(don't Forget to unmounts the existing swap disk space before adding the new space)
6. Restore the backup to the second disk .
