SiteScope OBM Integration

Wednesday, July 10, 2024 5:10 AM

Overview

SiteScope is an agentless monitoring solution that enables you to remotely monitor the availability and performance of your IT infrastructure (for example, servers, operating systems, network devices, network services, applications, and application components).
The SiteScope integration with OBM has multiple parts, which you can enable individually or in combination. The parts of the integration are:

- Event integration: SiteScope can forward events to OBM.
- Topology integration: SiteScope can forward topology information to OBM.
- Configuring and deploying SiteScope monitors from OBM: OBM provides a script that enables you to import templates from a SiteScope server to include them in aspects, thus allowing you to manage the configuration and deployment of SiteScope monitors from within OBM.

Steps To integrate SiteScope With OBM

1. Add SiteScope As a trusted Source in the OBM

Add integrated servers as trusted sources of content

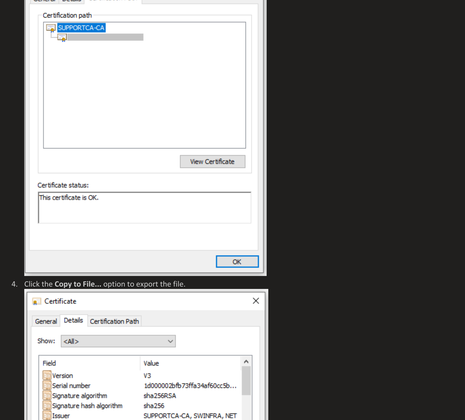
You must add the host name or port number of the product you plan to integrate with OBM in the `Content Security Policy (CSP) trusted sources` infrastructure setting. This ensures that the Content Security Policy header of OBM considers the integrated server a trusted source of content. The OBM UI shows content, including logos, images, and icons, only from trusted sources added in the infrastructure setting. The OBM UI can't show content from servers that aren't added as trusted sources. Similarly, the servers that aren't added as trusted sources can't show content from OBM in their UI.
Follow the below steps to add the host name or port number of the integrated server:

1. In the OBM UI, go to **Administration** > **Setup and Maintenance** > **Infrastructure Settings**.
2. Navigate to **Security** > **Apache WebServer Security** and locate the `Content Security Policy (CSP) trusted sources` infrastructure setting.
3. Add the host name and port number (if using a non standard port for http/https) of the server in the **Value** field, and then click **Save**.
   The `Protection against Clickjacking attacks` infrastructure setting is replaced with the `Content Security Policy (CSP) trusted sources` infrastructure setting. The value from the former hasn't migrated to the new infrastructure setting. Therefore, you must add all the servers that you consider a trusted source of content (including logos, images, and icons) in the new infrastructure setting.
4. Restart OBM. For more information, see Start, stop, or restart OBM.

From <https://docs.microfocus.com/doc/Operations_Bridge_Manager/24.2/IntegrateHAdd_integrated_servers_as_trusted_sources_of_content>

2. Ensure that you can Login to SiteScope Server With admin user

OBM SiteScope integration will fail if the SiteScope User with No Password ,



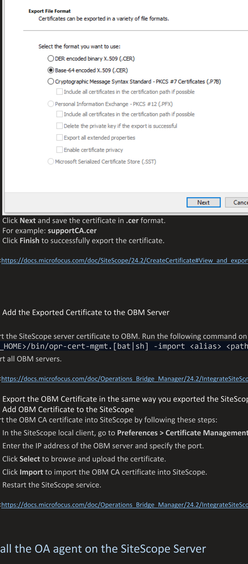
3. Exchange Certificates between OBM and SiteScope

- Export the SiteScope Certificate

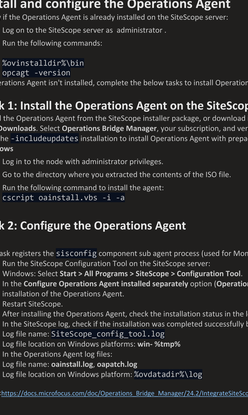
View and export SiteScope certificates

Follow these steps to export SiteScope certificates:

1. Enter the following format address on a browser to access the SiteScope: `https://<hostname_of_classic_SiteScope>:<port>/SiteScope`
   For example: `https://myhost.mycomputer.net:8443/SiteScope`
2. Open the **Certificate** window and go to the **Certificate Path** tab.
3. Select the certificate you want to export and click on the **Details** tab.



4. Click the **Copy to File...** option to export the file.



5. In the **Certificate Export** wizard, click **Next** and Export the certificate issued by the Certificate Authority in **Base-64 encoded X.509 (.CER)** format.

6. Click **Next** and save the certificate in **.cer** format.
   For example: **supportCA.cer**
7. Click **Finish** to successfully export the certificate.

From <https://docs.microfocus.com/doc/SiteScope/24.2/CreateCertificate#View_and_export_SiteScope_certificates>

- Add the Exported Certificate to the OBM Server

1. Import the SiteScope server certificate to OBM. Run the following command on all OBM servers:
   `<OBM_HOME>/bin/opr-cert-mgmt.[bat|sh] -import <alias> <path>`
2. Restart all OBM servers.

From <https://docs.microfocus.com/doc/Operations_Bridge_Manager/24.2/IntegrateSiteScope>

- Export the OBM Certificate in the same way you exported the SiteScope certificate
- Add OBM Certificate to the SiteScope

Import the OBM CA certificate into SiteScope by following these steps:

1. In the SiteScope local client, go to **Preferences > Certificate Management**. Click **New**. The Import Certificates page is displayed.
2. Enter the IP address of the OBM server and specify the port.
3. Click **Select** to browse and upload the certificate.
4. Click **Import** to import the OBM CA certificate into SiteScope.
5. Restart the SiteScope service.

From <https://docs.microfocus.com/doc/Operations_Bridge_Manager/24.2/IntegrateSiteScope>

4. Install the OA agent on the SiteScope Server

Install and configure the Operations Agent

Verify if the Operations Agent is already installed on the SiteScope server:

1. Log on to the SiteScope server as administrator .
2. Run the following commands:

```
%ovinstalldir%\bin
opcagt -version
```

If Operations Agent isn't installed, complete the below tasks to install Operations Agent.

Task 1: Install the Operations Agent on the SiteScope system

Install the Operations Agent from the SiteScope installer package, or download it from Software Support. In the Search box, type Operations Agent and click **Downloads**. Select **Operations Bridge Manager**, your subscription, and version. Then download the Operations Agent installation files.
Use the `-includeupdates` installation to install Operations Agent with prepackaged hotfixes. For details, see the *Operations Agent Help*.
Windows

1. Log in to the node with administrator privileges.
2. Go to the directory where you extracted the contents of the ISO file.
3. Run the following command to install the agent:
   `cscript oainstall.vbs -i -a`

Task 2: Configure the Operations Agent

This task registers the `sisconfig` component sub agent process (used for Monitoring Automation to deploy monitoring to SiteScope).

1. Run the SiteScope Configuration Tool on the SiteScope server:
   Windows: Select **Start > All Programs > SiteScope > Configuration Tool**.
2. In the **Configure Operations Agent installed separately** option (**Operations Agent** option in console mode), select **Configure Operations Agent** to complete the installation of the Operations Agent.
3. Restart SiteScope.
4. After installing the Operations Agent, check the installation status in the log files on the SiteScope server as follows:
   In the SiteScope log, check if the installation was completed successfully by searching for the results of `installOATask`.
   Log file name: `SiteScope_config_tool.log`
   Log file location on Windows platforms: **win- %tmp%**
   In the Operations Agent log files:
   Log file name: **oainstall.log**, **oapatch.log**
   Log file location on Windows platform: `%ovdatadir%\log`
